

## 变分推断 Background

频率角度  $\rightarrow$  优化问题贝叶斯角度  $\rightarrow$  积分问题

$$P(\theta|x) = \frac{P(x|\theta) \cdot P(\theta)}{P(x)}$$

后验 =  $\frac{\text{似然} \cdot \text{先验}}{\text{标准化}}$

$$\text{其中 } P(x) = \int P(x|\theta) P(\theta) d\theta$$

贝叶斯 inference: 求  $P(\theta|x)$ 贝叶斯 decision:  $X \rightarrow N$  个样本新样本, 求  $P(\hat{x}|X)$ 

$$P(\hat{x}|X) = \int P(\hat{x}, \theta|X) d\theta$$

$$= \int P(\hat{x}|\theta) P(\theta|X) d\theta$$

$$= E_{\theta|X} [P(\hat{x}|\theta)]$$

## 公式推导

 $X$ : observed data $Z$ : latent variable + parameter(对于 EM, 隐变量是  $Z$ , 参数是  $\theta$ ) $(X, Z)$ : complete data

$$\log P(X) = \log P(X, Z) - \log P(Z|X)$$

$$= \log \frac{P(X, Z)}{q(Z)} - \log \frac{P(Z|X)}{q(Z)}$$

对  $q$  求期望

$$\Rightarrow \int_Z \log P(X) q(Z) dZ = \log P(X)$$

$$\int_Z q(Z) \left( \log \frac{P(X, Z)}{q(Z)} - \log \frac{P(Z|X)}{q(Z)} \right) dZ$$

$$\text{因为 } f(w) = w^T X \quad \text{loss func } L(w) = \sum_i \|w^T x_i - y_i\|^2$$

$$\hat{w} = \arg \min_w L(w)$$

strategy 对应的 algorithm:

$$\textcircled{1} \text{ 解析解 } \frac{\partial L(w)}{\partial w} = 0 \Rightarrow w^* = (X^T X)^{-1} X^T Y$$

 $\textcircled{2} \text{ 数值解: gradient descent, SGD, ...}$ 

$$\text{SVM: } f(w) = \text{sign}(w^T X + b)$$

$$\text{Loss func } \min \frac{1}{2} w^T w \quad \text{s.t. } y_i (w^T x_i + b) \geq 1$$

$$\text{有约束, 凸优化} \quad i=1, 2, \dots, N$$

Lagrange Algorithm

$$\text{EM: } \hat{\theta} = \arg \max_{\theta} \log P(X|\theta)$$

$$\theta^{t+1} = \arg \max_{\theta} \int \log P(X, Z|\theta) P(Z|X, \theta^{(t)}) dZ$$

$$\text{右式} = \underbrace{\int_{\mathbf{Z}} q(\mathbf{Z}) \log \frac{P(\mathbf{X}, \mathbf{Z})}{q(\mathbf{Z})} d\mathbf{Z}}_{\text{ELBO (evidence lower bound)}} - \underbrace{\int_{\mathbf{Z}} q(\mathbf{Z}) \log \frac{P(\mathbf{Z}|\mathbf{X})}{q(\mathbf{Z})} d\mathbf{Z}}_{KL(q||p)}$$

ELBO  
(evidence lower bound)

$KL(q||p)$

$$= \mathcal{L}(q)$$

+

$KL(q||p) \geq 0$   
↑ 加号, 注意 KL 的定义

$$\hat{q}(\mathbf{Z}) = \underset{q(\mathbf{Z})}{\operatorname{argmax}} \mathcal{L}(q) \Rightarrow \hat{q}(\mathbf{Z}) \approx P(\mathbf{Z}|\mathbf{X})$$

假设  $q(\mathbf{Z}) = \prod_{i=1}^M q_i(\mathbf{Z}_i)$  统计学习中的 mean theory  
把  $q(\mathbf{Z})$  分成  $M$  份,  $M$  个份之间相互独立

$$\mathcal{L}(q) = \underbrace{\int_{\mathbf{Z}} q(\mathbf{Z}) \log P(\mathbf{X}, \mathbf{Z}) d\mathbf{Z}}_{\text{①}} - \underbrace{\int_{\mathbf{Z}} q(\mathbf{Z}) \log q(\mathbf{Z}) d\mathbf{Z}}_{\text{②}}$$

$$\text{①} = \int_{\mathbf{Z}} \prod_{i=1}^M q_i(\mathbf{Z}_i) \log P(\mathbf{X}, \mathbf{Z}) d\mathbf{Z}_1 d\mathbf{Z}_2 d\mathbf{Z}_3 \dots d\mathbf{Z}_M$$

$$= \int_{\mathbf{Z}} q_j(\mathbf{Z}_j) \left( \prod_{i \neq j}^M q_i(\mathbf{Z}_i) \log P(\mathbf{X}, \mathbf{Z}) d\mathbf{Z}_1 \dots d\mathbf{Z}_{j-1} d\mathbf{Z}_{j+1} \dots d\mathbf{Z}_M \right) d\mathbf{Z}_j$$

$$= \int_{\mathbf{Z}_j} q_j(\mathbf{Z}_j) \left( \int_{\mathbf{Z}_{i \neq j}} \log P(\mathbf{X}, \mathbf{Z}) \prod_{i \neq j}^M q_i(\mathbf{Z}_i) d\mathbf{Z}_i \right) d\mathbf{Z}_j$$

$$= \int_{\mathbf{Z}_j} q_j(\mathbf{Z}_j) E_{\prod_{i \neq j}^M q_i(\mathbf{Z}_i)} [\log P(\mathbf{X}, \mathbf{Z})] d\mathbf{Z}_j$$

$$\text{②} \int_{\mathbf{Z}} q(\mathbf{Z}) \log q(\mathbf{Z}) d\mathbf{Z}$$

$$= \int_{\mathbf{Z}} \prod_{i=1}^M q_i(\mathbf{Z}_i) \log \prod_{i=1}^M q_i(\mathbf{Z}_i) d\mathbf{Z} = \int_{\mathbf{Z}} \left( \prod_{i=1}^M q_i(\mathbf{Z}_i) \right) \left( \sum \log q_i(\mathbf{Z}_i) \right) d\mathbf{Z}$$

$$= \int_{\mathbf{Z}} \prod_{i=1}^M q_i(\mathbf{Z}_i) [\log q_1(\mathbf{Z}_1) + \log q_2(\mathbf{Z}_2) + \dots + \log q_M(\mathbf{Z}_M)] d\mathbf{Z}$$

对于分配律其中一项  $\int_{\mathbf{Z}} \prod_{i=1}^M q_i(\mathbf{z}_i) \log q_i(\mathbf{z}_i) d\mathbf{z}$

$$= \int_{\mathbf{z}_1, \mathbf{z}_2, \dots, \mathbf{z}_M} q_1 q_2 \dots q_M \log q_1 d\mathbf{z}_1 d\mathbf{z}_2 \dots d\mathbf{z}_M$$

$$= \int_{\mathbf{z}_1} q_1 \log q_1 d\mathbf{z}_1$$

因此  $\Theta = \int_{\mathbf{Z}} \prod_{i=1}^M q_i(\mathbf{z}_i) \sum_{i=1}^M \log q_i(\mathbf{z}_i) d\mathbf{z}$

$$= \sum_{i=1}^M \int_{\mathbf{z}_i} q_i(\mathbf{z}_i) \log q_i(\mathbf{z}_i) d\mathbf{z}_i$$

$$= \int_{\mathbf{z}_j} q_j(\mathbf{z}_j) \log q_j(\mathbf{z}_j) d\mathbf{z}_j + C$$

$$L(q) = \int_{\mathbf{z}_j} q_j(\mathbf{z}_j) E_{\prod_{i \neq j} q_i(\mathbf{z}_i)} [\log P(\mathbf{x}, \mathbf{z})] d\mathbf{z}_j - \int_{\mathbf{z}_j} q_j(\mathbf{z}_j) \log q_j + C$$

$$= \int_{\mathbf{z}_j} q_j(\mathbf{z}_j) \log \frac{\hat{P}(\mathbf{x}, \mathbf{z}_j)}{q_j(\mathbf{z}_j)} d\mathbf{z}_j$$

$$= -KL(q_j \| \hat{P}(\mathbf{x}, \mathbf{z}_j)) \leq 0$$

结论:

$$q_j(\mathbf{z}_j) \approx \hat{P}(\mathbf{x}, \mathbf{z}_j)$$
